PAR38-style LED light features multiple operating modes

Larson Electronics has announced the release of a multi-mode capable LED light with remote control that is compatible with standard PAR38 style light fixtures. The LED18W-PAR38-RGB 18 Watt RGB LED PAR 38 Remote Control Light provides innovative control and operating options with remote control operation and multi-color output choices as well as the ability to produce flashing, dimming, and strobing effects.

The Larson Electronics LED18W-PAR38-RGB 18 watt RGB LED PAR 38 remote control light is an innovative addition to their extensive line of LED offerings that gives operators a wide range of operating choices as well as the ability to control the operation of the unit via a handheld remote control. This LED lamp features a PAR38 design which allows it to work with most standard light sockets, allowing users to simply unscrew and replace common outdoor floodlights and interior bulbs. Operating features include a handheld remote control which allows the user to control all the functions and modes from up to 25 feet away, making this LED light ideal for installation in hard to reach areas. Functions include on/off control, the choice of 16 different light colors, and the ability to produce a constant on state, a fast or slow flash, strobing effects, color fade, and dimming. This light is far more versatile and durable than traditional halogen floodlights and produces 950 lumens in white color mode while using only 18 watts of power.

For comparison, a typical halogen floodlight will produce only 850 lumens while using 50 watts of power. Additionally, since this unit is LED, it is highly resistant to

damage from vibration or impacts, produces whiter cleaner light output without any yellow or reddish tint in white mode, and will operate for 50,000 or more hours before requiring replacement compared to the 500-1000 hour average of an incandescent or halogen bulb. These PAR38 LED lights are ideal for specialty applications and well suited for landscape or signage illumination where operators prefer to be able to alter color and on/off operation to achieve unique effects. These units are also well suited to commercial and industrial use where an operator requires specific light colors for specialized tasks and provides the ability to switch to normal illumination whenever desired.
