

Clean Demand v. Clean Supply

Energy News: America's demand for clean energy will beat supply by 37 percent in 2010, the National Renewable Energy Lab will report next week -- that's according to [USA Today](#) [1]. They also explain how half of the states require certain percentages of their providers' power to come from clean energy, and how there's a problem because the target numbers are in danger of not being reached, even with consumer price increases. (The NREL, if you're not familiar, does some amazing research and development. Scan [their news releases](#) [2] and you'll see a wide variety of sci-fi energy topics beginning to enter reality.)
