

Underfloor Branch Circuit Monitoring System

Power Distribution, Inc. has announced its J Comm BCMS system that fits under a raised floor, and it will monitor current, voltage and other power related measures for up to 168 branch breakers. Its compact design facilitates installation, and it will help data center managers track and control the power usage in all distribution equipment in new or existing data centers. This system has two BCMS communication boards and interface modules for either split core or solid core current transformers. The system monitors each individual circuit branch breaker, and it prevents overloading any of these circuits. With the system installed under the floor, there will be either a Modbus or SNMP connection to the building management system.
