

Power Module Input Connectors

CONEC announces its power module input connectors with integrated filters. They are designed to meet the PICMG MicroTCA specifications for power input modules which states that power module input connectors should have EMI shielding and filtering options. A range of 7W2 dual port connectors for 48V/60V with integrated low pass filters meets the different demands of various applications. The integration of filters in the connectors allows real estate PCB space savings. The connectors are made with precision screw machined contacts to fulfill and exceed the current carrying capabilities specified by PICMG. CONEC Corp.
