

## VGA and XGA resolution TFT LCDs

Apollo Display Technologies has announced that it can furnish VGA and XGA resolution TFT LCDs backlit by LED rails that are addressable via the company's standard PRISMA II industrial controller board to switch back and forth between day and night modes. These LCDs can be used in the full range of night vision imaging systems (NVIS) applications including displays in military aircraft cockpits, tanks, trucks, ground mobile applications, communications equipment and electronics. Two versions are available: NVIS A for upper echelon applications and NVIS B for applications with less stringent requirements. An 8.4" diagonal NVIS-compatible LCD is available which will be scalable up to 15" diagonal. All LCDs are fully ROHS-compliant.
