

USB 2.0 Device Controller

Altera Corp. introduces a complete USB 2.0 hi-/full-speed device controller from System Level Solutions. It is comprised of a soft IP core, software and class drivers and proprietary snap-on PHY daughtercards. Applications are in the consumer, medical, industrial, storage and automotive infotainment markets. This device controller is protocol compliant and multiple versions are available, allowing designers to add the protocol demanded by their application. A FIFO interface version is also available. Users can download and evaluate a small, three-endpoint reference design for immediate design, simulation and programming of the combined development kit and PHY daughtercard before the core is licensed.
