

Touchless Rotary Sensors With Unique Locator Technology

Novotechnik's rotary position sensors now include the RFC and Vert-x E series, designed for mobile and other limited-space environments. The sensors have a new touchless technology, which eliminates the shaft, and has a round position marker that mounts separately to distance itself from the detecting element. Sensor diameters range from 13 mm to 48 mm; the larger sizes also have rotary angle sensors. All are sealed up to IP69K for rugged conditions. Specifications include a programmable angle range to 360°, resolution to 14-bits and configurations such as analog, incremental, SPI, PWM, and redundant outputs.
