

AdvancedTCA Handle Does Not Require Assembly

Elma Electronic Inc. announced a second Generation AdvancedTCA (ATCA) handle that does not require assembly. The one-piece handle simply has two screws to attach it to the panel/PCB. The handle's alignment pin is part of the handle mold, making it sturdier and increasing drop-test survivability. The handle is engaged/disengaged with a unique slide-motion which prevents the handle from being accidentally tripped or bumped into and broken. The slide-motion switch opens the handle 30 degrees and activates the micro-switch. This allows the user to grab the handle easily and maximize leverage.
