

LED Lighting Modules Seamlessly Integrate On Cameras

The Imaging Source announced a series of LED lighting modules that seamlessly integrate with The Imaging Source USB, FireWire and GigE camera. The modules' features include very bright LEDs; direct connection to the camera; all parameters can be set via the shipped software, IC Capture and IC; imaging control or by custom built software; and compatibility with the Imaging Source USB CCD cameras, FireWire cameras and GigE cameras. All cameras manufactured by The Imaging Source ship with IC Capture and IC Imaging Control. The former is an end-user application, with which it is possible to set all camera parameters, save singular images and image sequences and display live video streams. IC Imaging Control is an SDK, which consists of a .NET component, ActiveX control and C++ class library for Windows XP and Windows Vista.
