

## Thermal Camera Combines Visible, IR Images

Combining visible-light capability with IR imaging, the FLIR i-Series thermal-imaging IR camera from Extech Instruments can provide a scalable and independently-adjustable picture-in-picture “fusion” image of the target showing both the visible target outline and the IR focus spot in the same frame. The pistol-grip device has a 3.5” LCD and comes in versions with image-capture resolutions of 120 × 120, 140 × 140, or 180 × 180 pixels. Features include temperature measurement accuracy as high as 2 percent and a 0.1°C thermal sensitivity.
