

Software Offers Full Control

Designed to communicate with CellMite or CellMite LVDT digitalizing signal conditioners, CellView graphical user interface software by Electro Standards Laboratories allows users to monitor, visualize, and refine data from sensors and set up tests automatically. With a GUI, users are guided through sensor calibration, tare/reset peak and valley as well as setting the filter level of the sensor. The CellView also enables users to create their own unit of measure, offers real-time editable graph display, and provides the option to save, print, or export reports.
