

AMC Handles Feature Die-cast Construction, Ergonomic Design

Elma Electronic Inc. offers Advanced Mezzanine Card (AMC) injector/ejector handles. AMCs are the main boards for MicroTCA designs and are also implemented in some AdvancedTCA applications. The AMC handles feature exceptional quality and precision milling, so that even the toughest tolerances can be achieved. Compliant to latest AMC/MicroTCA specifications, the handles have a die-cast construction. The ergonomic design has grooves for easy handling and positive detents at three distinct positions. The Elma handles have an optional micro-switch that fits all of the locations listed in the MicroTCA.0 specification. An optional LED indicator light guide is available with a die-cast zinc bright chromate faceplate that provides strength and durability. The clear polycarbonate light guide easily snaps into faceplate.
