

# Solid Electrolytic Chip Capacitor

Inelco Hunter introduces the Sanyo POSCAP TPG series of solid electrolytic chip capacitors that combine a low ESR at high frequency with high capacitance in low-profile packages. The anode is sintered tantalum and the cathode is a highly-conductive polymer formed using Sanyo's original technology. With high heat resistance, they are suitable for high-frequency digital applications. They have self-healing mechanisms which prevent short circuits, making them safer than ordinary tantalum capacitors, and they can retain high capacitance with bias voltage. Applications include DC/DC converters, personal computers, VCRs/camcorders/digital cameras, portable communications devices, PDAs, navigation systems and hard drives/DVD drives.
